WHAT IS B-RANIUM ?

B-RANIUM is the 1st token of its kind, what makes its originality is its tokenomics, which are based on the half-life, a real-life phenomenon. The name is a contraction of BSC and URANIUM.

The goal of B-RANIUM is not only to feature original tokenomics, but it is to be the governance token of a whole ecosystem, which will be populated by original tokens.

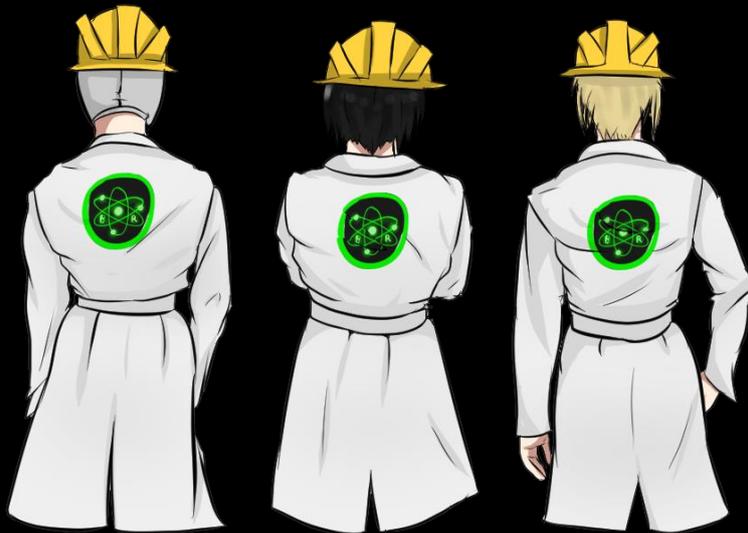

A bit more about the half-life :

A half-life in physics is the time required for half of something to undergo a process. When we talk about nuclear physics, it is the time required for half of the atoms of a radioactive substance to become disintegrated.

How was it implemented into the tokenomics ?

To make it short, holders of B-RANIUM can sell up to 50% of their bag per transaction. Once the first sale has been initiated, the holder enters in their half-life period countdown, and will be able to again initiate a sale after the half-life period finished. Again, the holder will be able to sell up to 50% of their bag and so on. People can (re)purchase tokens at any moment though.

Who is the team behind B-RANIUM ?

Behind B-RANIUM, there is a 3 people team working full-time on the project. We have partners with who we work for specific parts such as marketing, to make sure everyone masters their part of the work.

We have been in the crypto scene for years for some of us, but we started to get involved in a more “behind the scene” position last year.

We are a very dedicated team, our goal is to work full-time in the crypto world, and that’s the reason why we decided to create B-RANIUM.

Is there any real benefit from these tokenomics apart from just being original?

Yes, the tokenomics of B-RANIUM, are original, but the main point is not to be original, it is to be efficient. There are two main benefits from these tokenomics:

The first one is that we are constantly building a higher price floor. People who want to sell and leave the project will probably leave 5% or 3% of what's in their wallet on their departure.

These dusts of tokens in their wallet, are actually building a higher price floor, so even those who decide to sell and leave the project are actually contributing to it.

Also, a very important point is that, the number of holders of B-RANIUM, can ONLY increase. This will help the token to evolve, especially towards listings.

What is the ecosystem you talked about?

Our plan is not to launch a token, juice it out and then move on to another token.

B-RANIUM is the first brick of the empire.

We want to create an ecosystem of tokens, with original tokenomics which would be complementary to each-others.

B-RANIUM would be the core of that, since holding it would give you benefits for future tokens of the ecosystem, such as whitelists, or discounts on taxes for example. We also plan to rewards our most diamond-hands holders, those who will never have sold a token.

We really want to interact with the community, and we want them to be able to share their opinions and ideas about future tokens. The community part of B-RANIUM is one of the most important for us. This ecosystem being very versatile, it allows it to fit to a large range of things the blockchain can offer.

Concretely, how much can I sell ?

First of all, everybody starts at zero, this means that your first sale can be initiated when ever you want. After that, the timestamp of your sale is saved on the smart-contract and you will be able to initiate another sale after the half-life period will be finished:

$$\text{Last_sell_timestamp} + \text{half-life} < \text{current_timesctamp}$$

When you decide to sell, the amount can be up to 50% of your current wallet. If for example someone would keep selling the maximum amount at the end of each half-life (let's say that the half-life would be 10 hours), here what it would look like:

**PROGRESSION OF A WALLET SELLING MAX AMOUNTS
AFTER EVERY H-L PERIODS**

After 10 hours 75% sold

After 20 hours 87.5% sold

After 30 hours 93.8% sold

After 40 hours 96.9% sold

You can calculate this by yourself using the formula:

$$1 - 0.5^n$$

(n being the number of sales of the max amount)

ROADMAP

- Website launch
- Dashboard release
- Whitepaper release
- Create an explanatory video
- Pre-launch marketing campaign
- Pre-launch AMAs with the community
- Presale launch
- Token launch

1,000 Holders

Contests and gifts for the community

Ads on PooCoin & Bogged

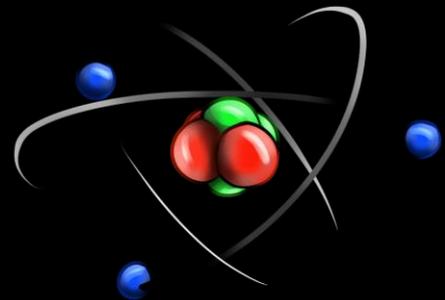

Partnerships with big youtubers

Certificate audit

Influencer push

Listing on CoinGecko

Listing on CoinMarketCap

5,000 Holders

Expansion of the B-RANIUM ecosystem

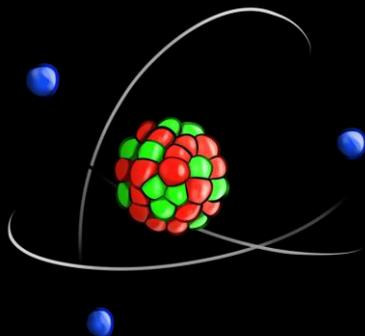

Partnerships with big crypto projects

Launch of a B-RANIUM rewarding token

Launch of physical merchandising

Team expansion

Mobile application

Aren't you scared that these limits on sales might scare people to invest ?

As shown previously, with a half-life of 10 hours, people can sell 75% of their bag in just 10 hours (since the 1st sale can be initiated at any moment).

If people are scared because they want to sell more than 75% of their bag in less than 10 hours after launch, then they are better off the boat from the start.

People scared by these limitations are just people who want to dump their whole bag straight after launch to make money on those buying and believing in the project.

People enjoying the project and willing to hold it, taking profit by levels, won't even feel these limitations. And this is the people we are looking to gather in our community.

So no, we are not worried about that.

**THANK YOU FOR BEING PART OF
THE COMMUNITY.**
